

CBLS + ICN: allocations, GC, and useful work

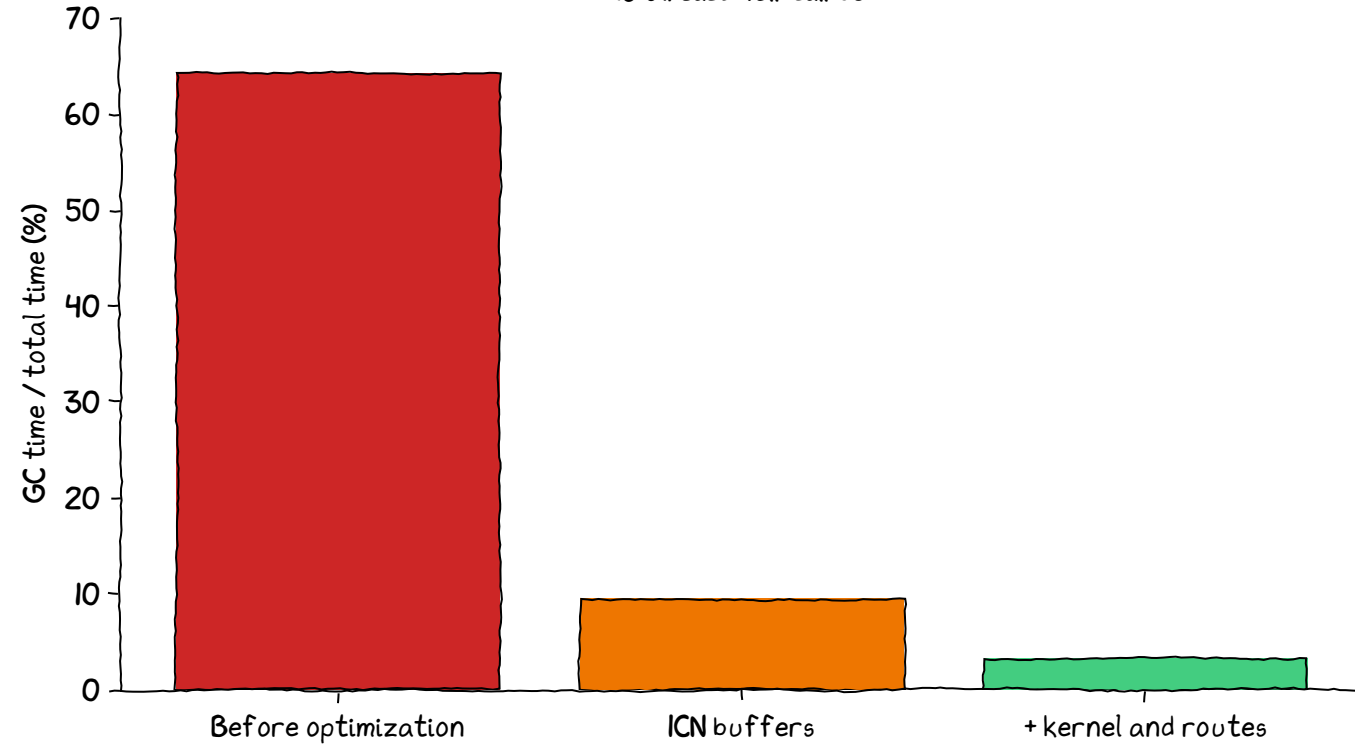

Worker utilization after optimization

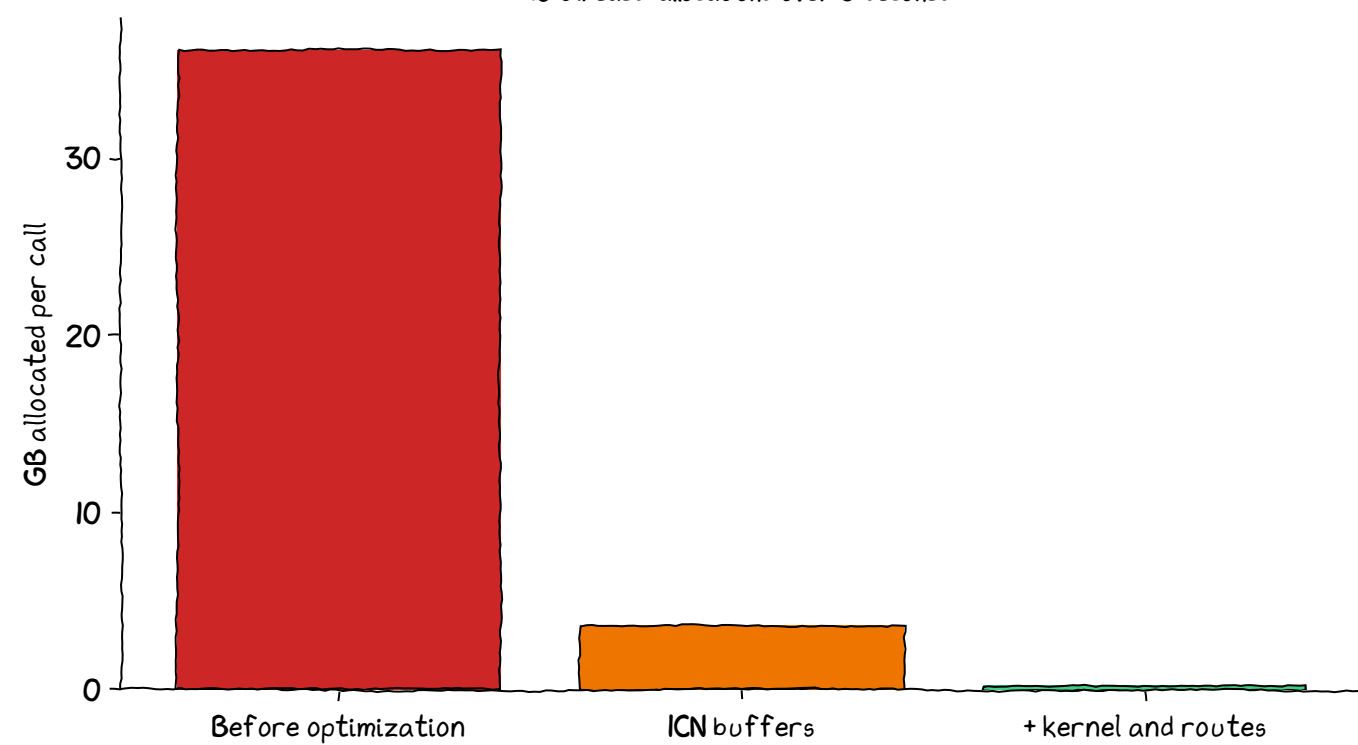

Throughput after optimization

16 threads: full-call GC

16 threads: allocations over 5 seconds

LCIOI · same ICN and neighborhoods · 3 seeds × 5 s, two 4-thread batches · Julia -O1 · GC = 1 thread
 Full-call GC includes the forced collection before search. Separate in-search measurement: 0.0 s.
 16 threads: 8 P-cores + 4 E-cores + 4 SMT lanes. Higher throughput does not imply better solutions.
