

Original LR101: CPU use and GC during identical bounded work

Markers: median of the three seed medians; bars: complete observation range. All 30 attempts per side/configuration/width retained.
 Pure lanes execute 1,024 steps; MetaStrategist executes eight finite episodes of 32 steps per lane with serial barriers, exchange and a single-threaded native master.
 Finite heterogeneous work can leave lanes waiting; this is not a sustained saturation test. GC shares cover measured operations only; the explicit pre-batch collection is excluded.
 Reserved physical P cores; independent E-core media and desktop activity can still share hardware resources. CPU accounting includes runtime/GC/native work, not only useful search.
