

Original LR101: complete qualified cohort — Allocated Julia objects

Markers: ratio of per-seed medians; bars: all 10 paired sample ratios (two order-reversed process rounds × five samples). Lower is better; no outliers removed.
 Each width has its own fixed original work and roles; 1,920 original-valid observations and complete trace/routes/RNG checks. Widths are not a strong-scaling or solution-quality comparison.
 Eight reserved physical P cores at most; single BLAS/GC/native HiGHS thread. Independent E-core media work may share memory and power; desktop background remains. Reference marks and all ranges stay visible.
